IT'S TIME FOR TELEMEDICINE.
Integrate RPM
Into Existing Clinical Workflows

A successful RPM program adds value to the clinician as much as to the patient. Use the continuity of vital signs data on each patient visit while easily viewing tabular and graphed patient data and patient compliance.

While it depends on the disease state a typical workflow can have one supervising clinician over one thousand or more patients. An associate can generally interact with 420 patients per month. This is despite the actual time per patient of 20 minutes in a 40 hour work week would lead to 480 patients in a fully efficient workflow.

Remote patient monitoring works in conjunction with chronic care management and behavioral health integrations CPT codes. While the time effort to each of these must remain separated the workflow of your staff allows for utilizing cross over to for example spend 40 minutes a month for CCM and RPM to boost overall productivity.
